Python Programming

Please follow below rules while designing automation script as

- Accept input through command line or through file.
- Display any message in log file instead of console.
- For separate task define separate function.
- For robustness handle every expected exception.
- Perform validations before taking any action.
- Create user defined modules to store the functionality.

Please add below features in our project named as Marvellous Data Shield System

1. Logging System

- Create a `Logs/` folder
- Store:
  - Backup start time
  - Files copied
  - Zip file name
  - Errors (if any)

2. Email Notification

- Send an email after backup completion
- Attach:
  - Log file
  - Zip file name

3. Restore Feature

- Add a command:

```
python Script.py --restore ZipFileName Destination
```

- Extract backup to given directory

4. Exclude Files / Folders

- Ignore:
  - `.tmp`, `.log`, `.exe`
  - or user-defined extensions

5. Backup History Tracker

- Maintain a file:
  - Date
  - Number of files
  - Zip size
- Display history using:

```
python Script.py --history
```
